Quadratic Sorting

**Data Structures
and Other Objects
Using C++**

- Chapter 13 presents several common algorithms for sorting an array of integers.
- Two slow but simple algorithms are Selectionsort and Insertionsort.
- This presentation demonstrates how the two algorithms work.

Sorting an Array of Integers

- The picture shows an array of six integers that we want to sort from smallest to largest

The Selectionsort Algorithm

- Start by finding the smallest entry.

The Selectionsort Algorithm

- Start by finding the **smallest** entry.
- Swap the smallest entry with the **first** entry.

The Selectionsort Algorithm

- Start by finding the **smallest** entry.
- Swap the smallest entry with the **first** entry.

The Selectionsort Algorithm

Sorted side

Unsorted side

- Part of the array is now sorted.

The Selectionsort Algorithm

Sorted side

Unsorted side

- Find the smallest element in the unsorted side.

The Selectionsort Algorithm

Sorted side

Unsorted side

- Find the smallest element in the unsorted side.
- Swap with the front of the unsorted side.

The Selectionsort Algorithm

- We have increased the size of the sorted side by one element.

The Selectionsort Algorithm

- The process continues...

The Selectionsort Algorithm

- The process continues...

The Selectionsort Algorithm

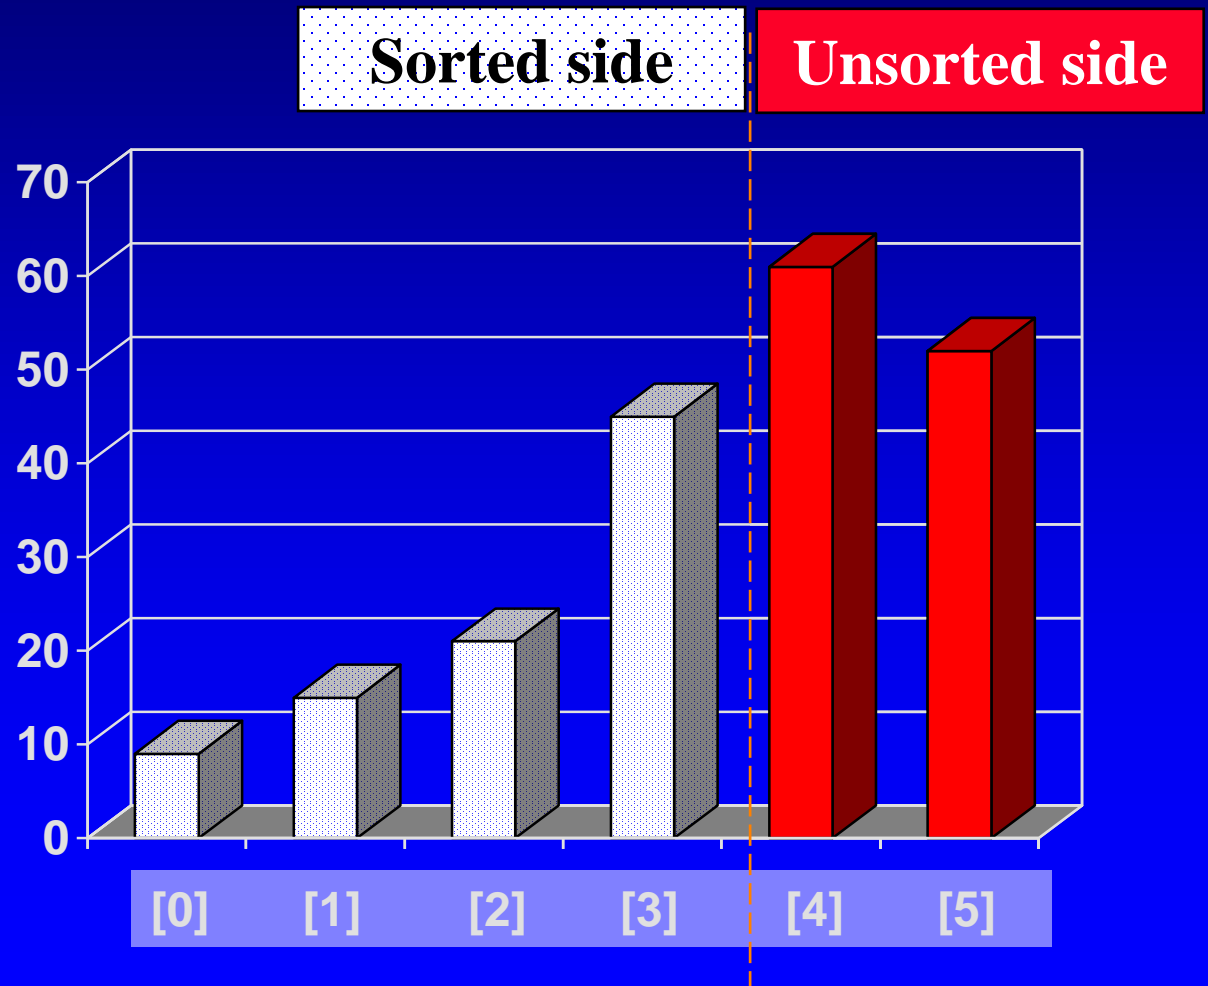

Sorted side
is bigger

- The process continues...

The Selectionsort Algorithm

- The process keeps adding one more number to the sorted side.
- The sorted side has the smallest numbers, arranged from small to large.

The Selectionsort Algorithm

- We can stop when the unsorted side has just one number, since that number must be the largest number.

The Selectionsort Algorithm

- The array is now sorted.
- We repeatedly selected the smallest element, and moved this element to the front of the unsorted side.

The Selectionsort Algorithm

- Question 1:
 - Can you write out the code?

- Question 2:
 - What is the Big-O of the selectionsort algorithm?

- Question 3:
 - Best case, worst case and average case
 - deterministic?

The Insertionsort Algorithm

- The Insertionsort algorithm also views the array as having a sorted side and an unsorted side.

The Insertionsort Algorithm

Sorted side

Unsorted side

- The sorted side starts with just the first element, which is not necessarily the smallest element.

The Insertionsort Algorithm

Sorted side

Unsorted side

- The sorted side grows by taking the front element from the unsorted side...

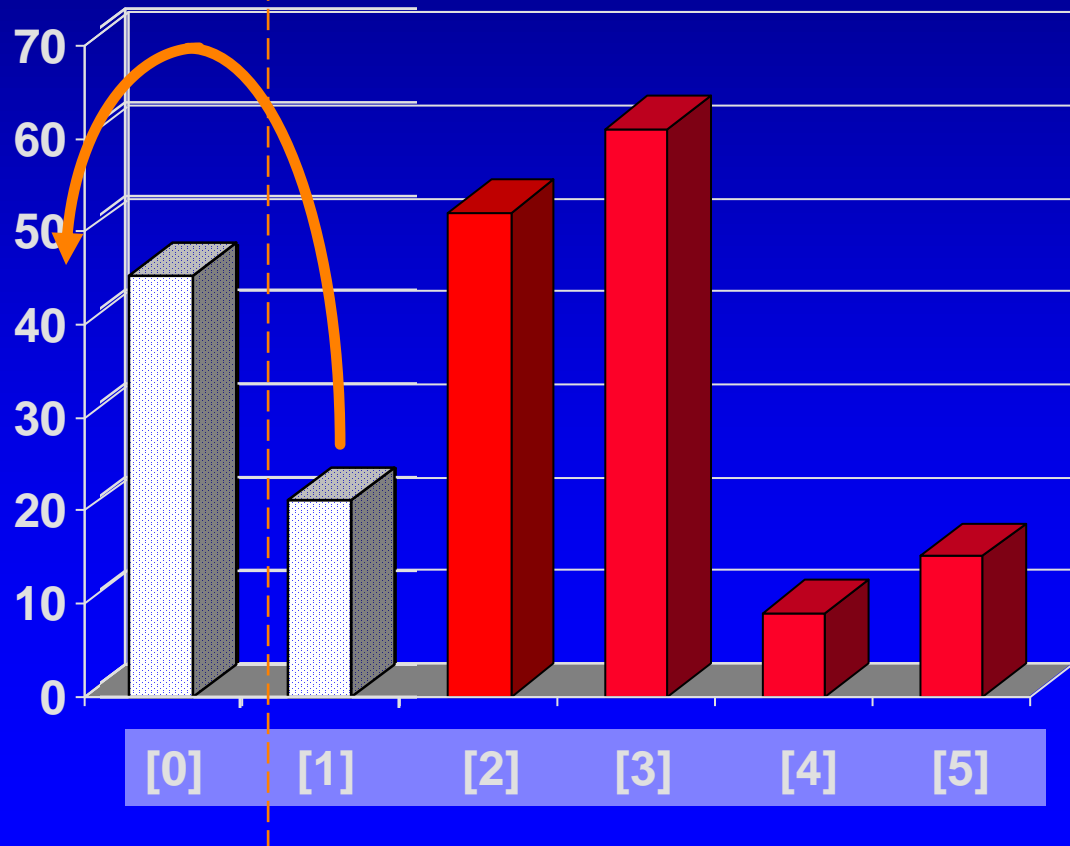

The Insertionsort Algorithm

Sorted side

Unsorted side

- ...and inserting it in the place that keeps the sorted side arranged from small to large.

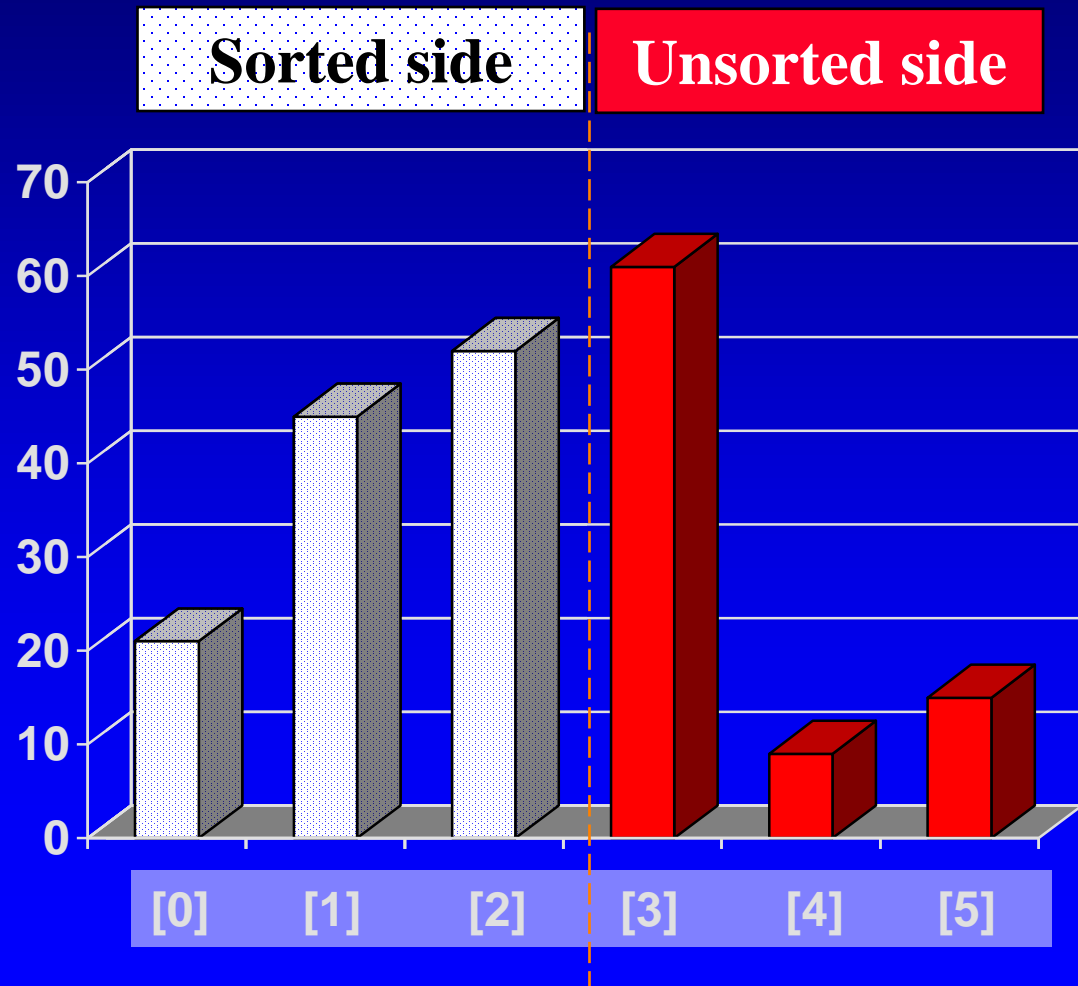

The Insertionsort Algorithm

- In this example, the new element goes in front of the element that was already in the sorted side.

The Insertionsort Algorithm

- Sometimes we are lucky and the new inserted item doesn't need to move at all.

The Insertionsort Algorithm

- Sometimes we are lucky twice in a row.

How to Insert One Element

- Copy the new element to a separate location.

How to Insert One Element

- Shift elements in the sorted side, creating an open space for the new element.

How to Insert One Element

- Shift elements in the sorted side, creating an open space for the new element.

How to Insert One Element

- Continue shifting elements...

How to Insert One Element

- Continue shifting elements...

How to Insert One Element

- ...until you reach the location for the new element.

How to Insert One Element

- Copy the new element back into the array, at the correct location.

How to Insert One Element

- The last element must also be inserted. Start by copying it...

A Quiz

How many shifts will occur before we copy this element back into the array?

A Quiz

□ Four items are shifted.

A Quiz

- Four items are shifted.
- And then the element is copied back into the array.

The Insertionsort Algorithm

- Question 1:
 - Can you write out the code easily?
- Question 2:
 - What is the Big-O of the insertsort algorithm?
- Question 3:
 - Best case, worst case and average case
 - deterministic?

Timing and Other Issues

- ❑ Both Selectionsort and Insertionsort have a worst-case time of $O(n^2)$, making them impractical for large arrays.
- ❑ But they are easy to program, easy to debug.
- ❑ Insertionsort also has good performance when the array is nearly sorted to begin with.
- ❑ But more sophisticated sorting algorithms are needed when good performance is needed in all cases for large arrays.
