Fourier Transform

Prof. George Wolberg
Dept. of Computer Science
City College of New York
Objectives

- This lecture reviews Fourier transforms and processing in the frequency domain.
  - Definitions
  - Fourier series
  - Fourier transform
  - Fourier analysis and synthesis
  - Discrete Fourier transform (DFT)
  - Fast Fourier transform (FFT)

Wolberg: Image Processing Course Notes
Background (1)

• Fourier proved that any periodic function can be expressed as the sum of sinusoids of different frequencies, each multiplied by a different coefficient. → Fourier series

• Even aperiodic functions (whose area under the curve is finite) can be expressed as the integral of sinusoids multiplied by a weighting function. → Fourier transform

• In a great leap of imagination, Fourier outlined these results in a memoir in 1807 and published them in *La Théorie Analytique de la Chaleur* (The Analytic theory of Heat) in 1822. The book was translated into English in 1878.
Background (2)

• The Fourier transform is more useful than the Fourier series in most practical problems since it handles signals of finite duration.
• The Fourier transform takes us between the spatial and frequency domains.
• It permits for a dual representation of a signal that is amenable for filtering and analysis.
• Revolutionized the field of signal processing.
Example

**FIGURE 4.1** The function at the bottom is the sum of the four functions above it. Fourier’s idea in 1807 that periodic functions could be represented as a weighted sum of sines and cosines was met with skepticism.
Useful Analogy

• A glass prism is a physical device that separates light into various color components, each depending on its wavelength (or frequency) content.
• The Fourier transform is a mathematical prism that separates a function into its frequency components.
Fourier Series for Periodic Functions
Fourier Transform for Aperiodic Functions
Fourier Analysis and Synthesis

- **Fourier analysis**: determine amplitude & phase shifts
- **Fourier synthesis**: add scaled and shifted sinusoids together
- **Fourier transform pair**:
  
  \[
  F(u) = \int_{-\infty}^{\infty} f(x) e^{-i2\pi ux} \, dx
  \]

  \[
  f(x) = \int_{-\infty}^{\infty} F(u) e^{i2\pi ux} \, dx
  \]

  where \( i = \sqrt{-1} \), and

  \[
  e^{\pm i2\pi ux} = \cos(2\pi ux) \pm i \sin(2\pi ux) \quad \text{← complex exponential at freq. } u
  \]

  \[\text{Euler’s formula}\]

Wolberg: Image Processing Course Notes
Fourier Coefficients

• Fourier coefficients $F(u)$ specify, for each frequency $u$, the amplitude and phase of each complex exponential.
• $F(u)$ is the frequency spectrum.
• $f(x)$ and $F(u)$ are two equivalent representations of the same signal.

$$F(u) = R(u) + iI(u)$$

$$|F(u)| = \sqrt{R^2(u) + I^2(u)} \leftarrow \text{magnitude spectrum; aka Fourier spectrum}$$

$$\Phi(u) = \tan^{-1} \frac{I(u)}{R(u)} \leftarrow \text{phase spectrum}$$

$$P(u) = |F(u)|^2$$

$$= R^2(u) + I^2(u) \leftarrow \text{spectral density}$$
1D Example

\[ f(x) = \begin{cases} A & 0 \leq x \leq W \\ 0 & x > W \end{cases} \]

\[ F(u) = \int_{-\infty}^{\infty} f(x)e^{-i2\pi ux} \, dx \quad \text{note: } \int e^{ax} \, dx = \frac{1}{a} e^{ax} \]

\[ F(u) = \int_{0}^{W} Ae^{-i2\pi ux} \, dx \]

\[ F(u) = \frac{-A}{i2\pi u} \left[ e^{-i2\pi u} \right]^W = \frac{-A}{i2\pi u} \left[ e^{-i2\pi W} - 1 \right] = \frac{A}{i2\pi u} \left[ 1 - e^{-i2\pi uW} \right] \]

\[ F(u) = \frac{A}{i2\pi u} \left[ e^{i\pi uW} - e^{-i\pi uW} \right] e^{-i\pi uW} \quad \text{note: } \sin x = \frac{e^{ix} - e^{-ix}}{2i} \]

\[ F(u) = \frac{A}{\pi u} \sin(\pi uW) e^{-i\pi uW} \quad \leftarrow \text{complex function} \]

\[ |F(u)| = \left| \frac{A}{\pi u} \left| \sin(\pi uW)e^{-i\pi uW} \right| \right| = AW \left| \frac{\sin(\pi uW)}{\pi uW} \right| = AW \left| \sin(c(\pi uW)) \right| \]

where \( \text{sinc}(x) = \frac{\sin(\pi x)}{\pi x} \)

*some books have \( \text{sinc}(x) = \frac{\sin(x)}{x} \)*

Wolberg: Image Processing Course Notes
**FIGURE 4.3**

(a) Image of a 20 × 40 white rectangle on a black background of size 512 × 512 pixels.

(b) Centered Fourier spectrum shown after application of the log transformation given in Eq. (3.2-2). Compare with Fig. 4.2.
Fourier Series (1)

For periodic signals, we have the Fourier series:

\[ f(x) = \sum_{n=-\infty}^{n=\infty} c(nu_0) e^{i2\pi u_0 x} \]

where \( c(nu_0) \) is the \( n^{th} \) Fourier coefficient.

\[ c(nu_0) = \frac{1}{x_0} \int_{-x_0/2}^{x_0/2} f(x) e^{-i2\pi u_0 x} dx \]

That is, the periodic signal contains all the frequencies that are harmonics of the fundamental frequency.
Fourier Series (2)

\[ c(nu_0) = \frac{1}{x_0} \int_{x_0/2}^{W/2} f(x)e^{-i2\pi nu_0 x} \, dx = \frac{1}{W} \int_{-W/2}^{W/2} Ae^{-i2\pi nu_0 x} \, dx \]

\[ c(nu_0) = \frac{A}{-i2\pi nu_0 x_0} (e^{-i\pi nu_0 W} - e^{+i\pi nu_0 W}) \]

\[ c(nu_0) = \frac{A}{\pi n} \sin(\pi nu_0 W) \quad \sin x = \frac{e^{ix} - e^{-ix}}{2i}; \quad u_0 x_0 = 1 \]

\[ c(nu_0) = \frac{Au_0 W}{\pi nu_0 W} \sin(\pi nu_0 W) = Au_0 W\text{sinc}(\pi nu_0 W) \]

Note that if \( \frac{W}{2} = \frac{x_0}{2} \), then we have a square wave and

\[ c(nu_0) = Au_0 x_0 \text{sinc}(\pi nu_0 x_0) \]

\[ c(nu_0) = \begin{cases} A \text{sinc}(n) & n = \pm 1, \pm 3, \cdots \\ 0 & n = 0, \pm 2, \pm 4, \cdots \end{cases} \]
Fourier Series (3)

- The Fourier transform is applied for aperiodic signals.
- It is represented as an integral over a continuum of frequencies.
- The Fourier Series is applied for periodic signals.
- It is represented as a summation of frequency components that are integer multiples of some fundamental frequency.
Example

Ex: Rectangular Pulse Train

\[ f(x) = \begin{cases} 
  A & |x| < \frac{W}{2} \\
  0 & |x| > \frac{W}{2} 
\end{cases} \quad \text{in interval}[-W/2, W/2] \]
### Discrete Fourier Transform

For $0 \leq u \leq N-1$ and $0 \leq x \leq N-1$ where $N$ is the number of equi-spaced input samples.

The $1/N$ factor can be in front of $f(x)$ instead.

$$F(u) = \frac{1}{N} \sum_{x=0}^{N-1} f(x)e^{-i2\pi \frac{ux}{N}} \quad \text{forward DFT}$$

$$f(x) = \sum_{u=0}^{N-1} F(u)e^{+i2\pi \frac{ux}{N}} \quad \text{inverse DFT}$$
Fourier Analysis Code

- DFT maps N input samples of f into the N frequency terms in F.

```c
for(u=0; u<N; u++) { /*compute spectrum over all freq. u */
    real = imag = 0; /*reset real, imag component of F(u)*/
    for(x=0; x<N; x++) { /* visit each input pixel */
        real += (f[x]*cos(-2*PI*u*x/N));
        imag += (f[x]*sin(-2*PI*u*x/N));
        /* Note: if f is complex, then
        real += (fr[x]*cos()-fi[x]*sin());
        imag += (fr[x]*sin()+fi[x]*cos());
        because (f_r+if_i)(g_r+ig_i)=(f_rg_r-f_i^*g_i)+i(f_i^*g_r+f_r^*g_i)
        */
    }
    Fr[u] = real / N;
    Fi[u] = imag / N;
}
```
Fourier Synthesis Code

```c
for(x=0; x<N; x++) {/* compute each output pixel */
    real = imag = 0;  /* reset real, imaginary component */
    for(u=0; u<N; u++) {
        c = cos(2*PI*u*x/N);
        s = sin(2*PI*u*x/N);
        real += (Fr[u]*c-Fi[u]*s);
        imag += (Fr[u]*s+Fi[u]*c);
    }
    fr[x] = real;  /* OR f[x] = sqrt(real*real + imag*imag); */
    fi[x] = imag;
}
```
Example: Fourier Analysis (1)

Summary

Continuous \(\{\)
- Periodic \((\text{period } T)\) \(\text{FS} \quad \text{Discrete}\)
- Aperiodic \(\text{FT} \quad \text{Continuous}\)

Discrete \(\{\)
- Periodic \((\text{period } T)\) \(\text{DFS} \quad \text{Discrete}\)
- Aperiodic \(\text{DTFT} \quad \text{Continuous}\)
- \(\text{DFT} \quad \text{Discrete}\)

\[c_k = \frac{1}{T} \int_0^T s(t) \cdot e^{-ik\omega t} \, dt\]
\[S(f) = \int_{-\infty}^{\infty} s(t) \cdot e^{-i2\pi ft} \, dt\]
\[\tilde{c}_k = \frac{1}{N} \sum_{n=0}^{N-1} s[n] \cdot e^{-\frac{2\pi fn}{N}}\]
\[S(f) = \sum_{n=-\infty}^{\infty} s[n] \cdot e^{-i2\pi fn}\]
\[\tilde{c}_k = \frac{1}{N} \sum_{n=0}^{N-1} s[n] \cdot e^{-\frac{2\pi fn}{N}}\]

Note: \(i = \sqrt{-1}, \quad \omega = 2\pi/T, \quad s[n] = s(t_n), \quad N = \# \text{ of samples}\)
2D Fourier Transform

Continuous:

\[ F\{f(x, y)\} = F(u, v) = \int \int f(x, y)e^{-i2\pi(ux+vy)} \, dx = \int \int f(x, y)e^{-i2mu}e^{-i2mv} \, dx \]

\[ F^{-1}\{F(u, v)\} = f(x, y) = \int \int F(u, v)e^{i2\pi(ux+vy)} \, dx = \int \int F(u, v)e^{i2mu}e^{i2mv} \, dx \]

Separable: \( F(u, v) = F(u)F(v) \)

Discrete:

\[ F(u, v) = \frac{1}{MN} \sum_{x=0}^{M-1} \sum_{y=0}^{N-1} f(x, y)e^{-i2\pi(\frac{ux}{N} + \frac{vy}{M})} \, dx = \frac{1}{M} \sum_{y=0}^{M-1} \left[ \frac{1}{N} \sum_{x=0}^{N-1} f(x, y)e^{-i2\pi(\frac{ux}{N})} \right] e^{-i2\pi(\frac{vy}{M})} \]

\[ f(x, y) = \sum_{x=0}^{M-1} \sum_{y=0}^{N-1} F(u, v)e^{i2\pi(\frac{ux}{N} + \frac{vy}{M})} \, dx = \sum_{y=0}^{N-1} \left[ \sum_{x=0}^{M-1} F(u, v)e^{i2\pi(\frac{ux}{N})} \right] e^{i2\pi(\frac{vy}{M})} \]
Separable Implementation

\[ F(u, v) = \frac{1}{N} \sum_{y=0}^{N-1} e^{-j\frac{2\pi vy}{N}} \frac{1}{M} \sum_{x=0}^{M-1} f(x, y)e^{-j\frac{2\pi ux}{M}} \]

\[ = \frac{1}{N} \sum_{y=0}^{N-1} F(u, y)e^{-j\frac{2\pi vy}{N}} \]

\[ \text{where} \quad F(u, y) = \frac{1}{M} \sum_{x=0}^{M-1} f(x, y)e^{-j\frac{2\pi ux}{M}} \]

The 2D Fourier transform is computed in two passes:
1) Compute the transform along each row independently.
2) Compute the transform along each column of this intermediate result.
Properties

• Edge orientations in image appear in spectrum, rotated by 90°.
• 3 orientations are prominent: 45°, -45°, and nearly horizontal long white element.

Noise Removal

Original with noise patterns

Power spectrum showing noise spikes

Mask to remove periodic noise

Inverse FT with periodic noise removed
Fast Fourier Transform (1)

• The DFT was defined as:

\[
F(u) = \frac{1}{N} \sum_{x=0}^{N-1} f(x) e^{-i2\pi \frac{ux}{N}} \quad 0 \leq x \leq N - 1
\]

Rewrite:

\[
F_n = \frac{1}{N} \sum_{k=0}^{N-1} f_k e^{-i2\pi \frac{nk}{N}} \quad 0 \leq n \leq N - 1
\]

Let \( F_n = \sum_{k=0}^{N-1} f_k W^{nk} \)

where \( W = e^{-i2\pi/N} = \cos\left(-\frac{2\pi}{N}\right) + i\sin\left(-\frac{2\pi}{N}\right) \)

Also, Let \( N = 2^r \) (\( N \) is a power of 2)
Fast Fourier Transform (2)

- $W^{nk}$ can be thought of as a 2D array, indexed by $n$ and $k$.
- It represents $N$ equispaced values along a sinusoid at each of $N$ frequencies.
- For each frequency $n$, there are $N$ multiplications ($N$ samples in sine wave of freq. $n$). Since there are $N$ frequencies, DFT: $O(N^2)$
- With the FFT, we will derive an $O(N \log N)$ process.
FIGURE 4.42
Computational advantage of the FFT over a direct implementation of the 1-D DFT. Note that the advantage increases rapidly as a function of $n$. 
Danielson–Lanczos Lemma (1)

1942:

\[
F_n = \sum_{k=0}^{N-1} f_k e^{-i2\pi\frac{nk}{N}}
\]

\[
F_n = \sum_{k=0}^{\frac{N-1}{2}} f_{2k} e^{-i2\pi\frac{n(2k)}{N}} + \sum_{k=0}^{\frac{N-1}{2}} f_{2k+1} e^{-i2\pi\frac{n(2k+1)}{N}}
\]

Even Numbered Terms \hspace{1cm} Odd Numbered Terms

\[f_0, f_2, f_4, \cdots \hspace{1cm} f_1, f_3, f_5, \cdots\]
Danielson–Lanczos Lemma (2)

\[ F_n = \sum_{k=0}^{\frac{N-1}{2}} f_{2k} e^{-\frac{i 2\pi mk}{N/2}} + W^n \sum_{k=0}^{\frac{N-1}{2}} f_{2k+1} e^{-\frac{i 2\pi mk}{N/2}} \]

\[ W = e^{-\frac{i 2\pi}{N}} \]

\[ F_n = F_n^e + W^n F_n^o \]

\(^n\text{th}\) component of F.T. of length \(N/2\) formed from the even components of \(f\)

\(^n\text{th}\) component of F.T. of length \(N/2\) formed from the odd components of \(f\)

Divide-and-Conquer solution: Solving a problem \((F_n)\) is reduced to 2 smaller ones.

Potential Problem: \(n\) in \(F_n^e\) and \(F_n^o\) is still made to vary from 0 to \(N-1\). Since each sub-problem is no smaller than original, it appears wasteful.

Solution: Exploit symmetries to reduce computational complexity.
Danielson–Lanczos Lemma (3)

Given: a DFT of length \(N\), \(F_{n+N} = F_n\)

Proof: \(F_{n+N} = \sum_{k=0}^{N-1} f_k e^{-\frac{i 2 \pi (n+N) k}{N}} = \sum_{k=0}^{N-1} f_k e^{-\frac{i 2 \pi k}{N}} e^{-\frac{i 2 \pi N k}{N}} = \)

\[= \sum_{k=0}^{N-1} f_k e^{-\frac{i 2 \pi k}{N}} (\cos 2\pi k - i \sin 2\pi k) = \sum_{k=0}^{N-1} f_k e^{-\frac{i 2 \pi k}{N}} = F_n\]

\[W^{\frac{n+N}{2}} = \cos\left(\frac{-2\pi}{N} \left(n + \frac{N}{2}\right)\right) + i \sin\left(\frac{-2\pi}{N} \left(n + \frac{N}{2}\right)\right)\]

\[= \cos\left(\frac{-2\pi n}{N} - \pi\right) + i \sin\left(\frac{-2\pi n}{N} - \pi\right)\]

\[= -\cos\left(\frac{-2\pi n}{N}\right) - i \sin\left(\frac{-2\pi n}{N}\right)\]

\[= -W^n\]
Main Points of FFT

\[ F_n = \sum_{k=0}^{N-1} f_k e^{-i 2 \pi \frac{nk}{N}} \]

\[ F_n = F_n^e + W^n F_n^o \]

length \( N \) \quad \text{length} \( \frac{N}{2} \) \quad \text{length} \( \frac{N}{2} \)

but \( 0 \leq n < N \)

Wolberg: Image Processing Course Notes
FFT Example (1)

- Input: 10, 15, 20, 25, 5, 30, 8, 4
FFT Example (2)

\[ F_n = F_n^e + W^n F_n^o \]

\[ F_n = F_n^e - W^n F_n^o \]

\[ W^1 = e^{-i2\pi/4} = -i \]

\[ W^1 = e^{-i2\pi/8} = B \]

\[ W^2 = e^{-i4\pi/8} = C \]

\[ W^3 = e^{-i6\pi/8} = D \]

(see next page for weights B, C, D)
Weights

- DFT is a convolution with kernel values $e^{-i2\pi ux/N}$
- These values are derived from a unit circle.
DFT Example (1)

• Input: 10, 15, 20, 25, 5, 30, 8, 4

\[ F_n = \sum_{k=0}^{N-1} f_k e^{-i2\pi nk/N} \]

\[ F_0 = 10 + 15 + 20 + 25 + 5 + 30 + 8 + 4 = 117 \]

\[ F_1 = 10e^{-i2\pi(1)(0)/8} + 15e^{-i2\pi(1)(1)/8} + 20e^{-i2\pi(1)(2)/8} + \ldots + 8e^{-i2\pi(1)(6)/8} + 4e^{-i2\pi(1)(7)/8} \]

\[ = 10A + 15B + 20C + 25D + 5E + 30F + 8G + 4H \]

\[ F_2 = 10e^{-i2\pi(2)(0)/8} + 15e^{-i2\pi(2)(1)/8} + 20e^{-i2\pi(2)(2)/8} + \ldots + 8e^{-i2\pi(2)(6)/8} + 4e^{-i2\pi(2)(7)/8} \]

\[ = 10A + 15C + 20E + 25G + 5A + 30C + 8E + 4G = -13 - 16i \]

\[ F_3 = 10e^{-i2\pi(3)(0)/8} + 15e^{-i2\pi(3)(1)/8} + 20e^{-i2\pi(3)(2)/8} + \ldots + 8e^{-i2\pi(3)(6)/8} + 4e^{-i2\pi(3)(7)/8} \]

\[ = 10A + 15D + 20G + 25B + 5E + 30H + 8C + 4F \]
DFT Example (2)

\[ F_4 = 10e^{-i2\pi(4)(0)/8} + 15e^{-i2\pi(4)(1)/8} + 20e^{-i2\pi(4)(2)/8} + \ldots + 8e^{-i2\pi(4)(6)/8} + 4e^{-i2\pi(4)(7)/8} \]
\[ = 10A + 15E + 20A + 25E + 5A + 30E + 8A + 4E = -31 \]

\[ F_5 = 10e^{-i2\pi(5)(0)/8} + 15e^{-i2\pi(5)(1)/8} + 20e^{-i2\pi(5)(2)/8} + \ldots + 8e^{-i2\pi(5)(6)/8} + 4e^{-i2\pi(5)(7)/8} \]
\[ = 10A + 15F + 20C + 25H + 5E + 30B + 8G + 4D \]

\[ F_6 = 10e^{-i2\pi(6)(0)/8} + 15e^{-i2\pi(6)(1)/8} + 20e^{-i2\pi(6)(2)/8} + \ldots + 8e^{-i2\pi(6)(6)/8} + 4e^{-i2\pi(6)(7)/8} \]
\[ = 10A + 15G + 20E + 25C + 5A + 30G + 8E + 4C = -13 + 16i \]

\[ F_7 = 10e^{-i2\pi(7)(0)/8} + 15e^{-i2\pi(7)(1)/8} + 20e^{-i2\pi(7)(2)/8} + \ldots + 8e^{-i2\pi(7)(6)/8} + 4e^{-i2\pi(7)(7)/8} \]
\[ = 10A + 15H + 20G + 25F + 5E + 30D + 8C + 4B \]

| Computation of the inverse Fourier transform using a forward transform algorithm | \[
\frac{1}{MN} f^*(x, y) = \frac{1}{MN} \sum_{u=0}^{M-1} \sum_{v=0}^{N-1} F^*(u, v)e^{-j2\pi(ux/M + vy/N)}
\]
| This equation indicates that inputting the function \( F^*(u, v) \) into an algorithm designed to compute the forward transform (right side of the preceding equation) yields \( f^*(x, y)/MN \). Taking the complex conjugate and multiplying this result by \( MN \) gives the desired inverse. |
| Convolution†                               | \[
\frac{1}{MN} \sum_{m=0}^{M-1} \sum_{n=0}^{N-1} f(m, n)h(x - m, y - n)
\]
| Correlation†                                | \[
\frac{1}{MN} \sum_{m=0}^{M-1} \sum_{n=0}^{N-1} f^*(m, n)h(x + m, y + n)
\]
| Convolution theorem†                        | \[
\begin{align*}
\text{Convolution theorem}^† & \quad f(x, y) \ast h(x, y) \leftrightarrow F(u, v)H(u, v); \\
\text{Correlation theorem}^† & \quad f(x, y)h(x, y) \leftrightarrow F^*(u, v) \circ H(u, v);
\end{align*}
\]
| Correlation theorem†                        | \[
\begin{align*}
\text{Correlation theorem}^† & \quad f^*(x, y)h(x, y) \leftrightarrow F^*(u, v) \circ H(u, v);
\end{align*}
\]
Some useful FT pairs:
